Cranial Asymmetry Repositioning Evaluation (CARE)

LifeScape Therapy and RISE Custom Solutions collaborate to provide the most innovative and comprehensive evaluations. Our expert team explores early detection, prevention and treatment for plagiocephaly and torticollis.

Early Detection

For both plagiocephaly and torticollis, early detection is vital for an effective treatment. Research shows a conservative treatment is most effective if it begins before your child turns 4 months old.

Prevention

Our team works with you by treating underlying torticollis, the turning or tilting of the neck and head, by providing individualized treatment and home repositioning recommendations. Our therapists' goal is to prevent the need for a cranial helmet.

Treatment

If helmet treatment is unavoidable, our expert therapists and cranial practitioners will work together on a cranial re-molding plan. It is not painful or uncomfortable for your baby and is highly effectively in treating plagiocephaly.

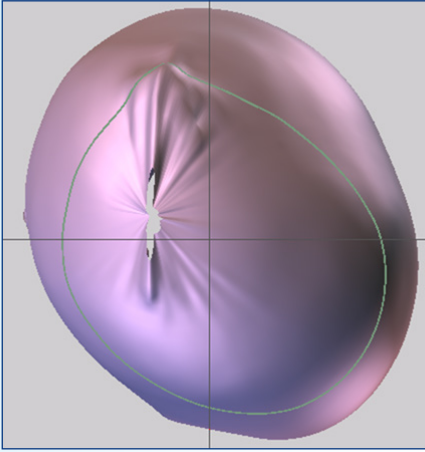

A Cranial Remolding Helmet therapy is a time-sensitive elective treatment for an infant's abnormal head shape exhibiting moderate to severe flattening or asymmetry. As infants reach 12 months of age, their skull bones become more firm and are generally less flexible to the molding effects of helmets. As a result, it is best to initiate remolding helmet treatment when the infant is young. Referrals to LifeScape/RISE need to be received as early as 1-2 months of age, but no later than 10 months of age to allow for the proper criteria and insurance authorizations to occur, and for best outcomes.

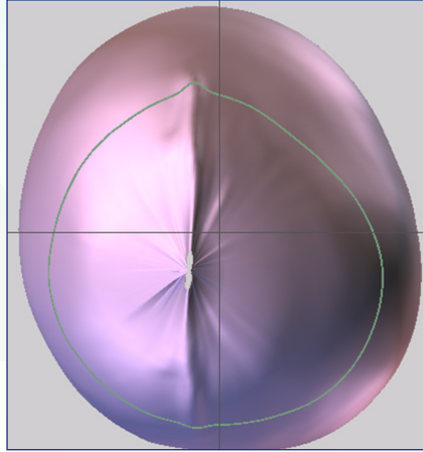

CARE Clinic

Cranial Remolding Evaluation & Treatment

We are fortunate to partner with STARband®, the most prescribed cranial remolding orthosis in the world. By being the only STARband® treatment center in the area, your baby will receive best-in-class care.
